

One column, start to finish. The canvas rises into it.

The transcript column from **1a** running straight into the spotlight canvas from **2b** — no threshold, no new page. Thirteen steps, desktop and mobile for each.

Triage 01–04

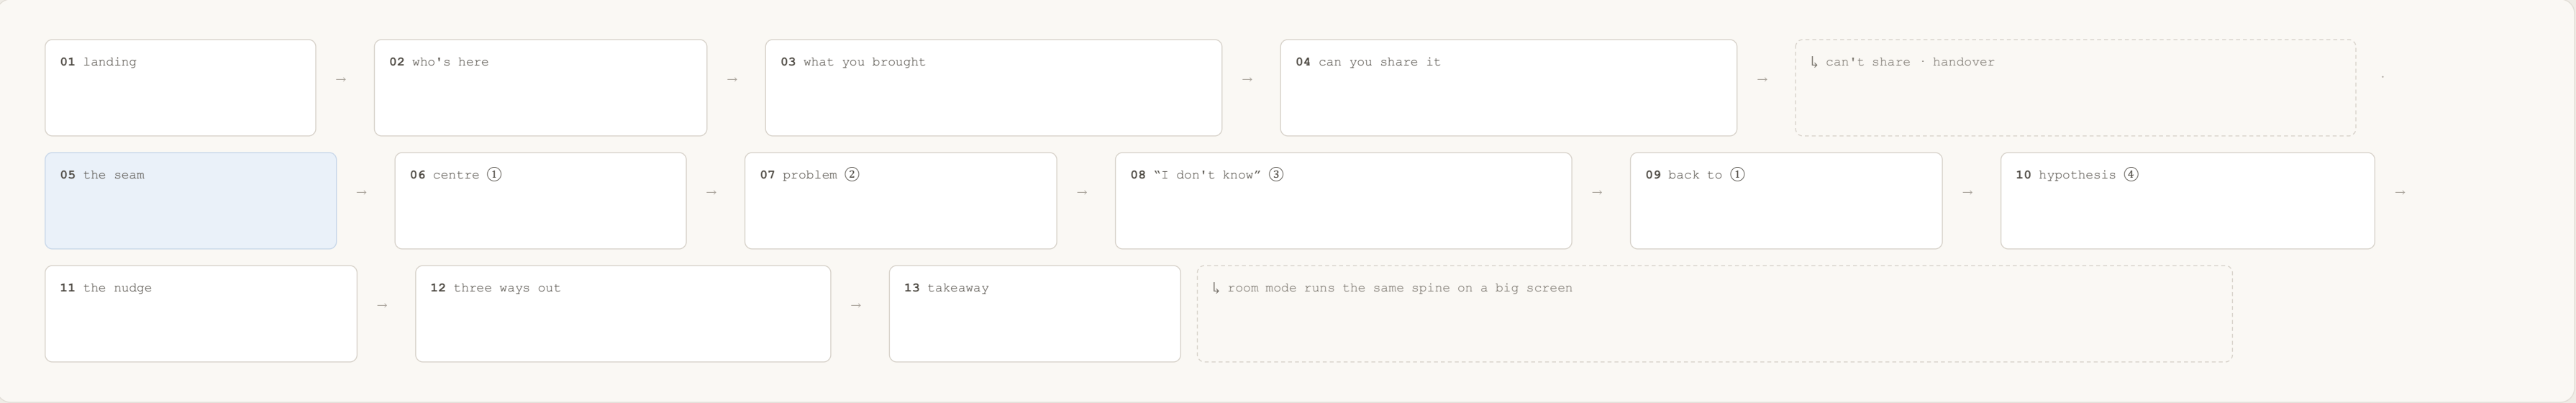

The seam 05

Coaching 06–11

Leaving 12–13

Thirteen steps, one spine, two off-ramps

HOW TO READ THESE

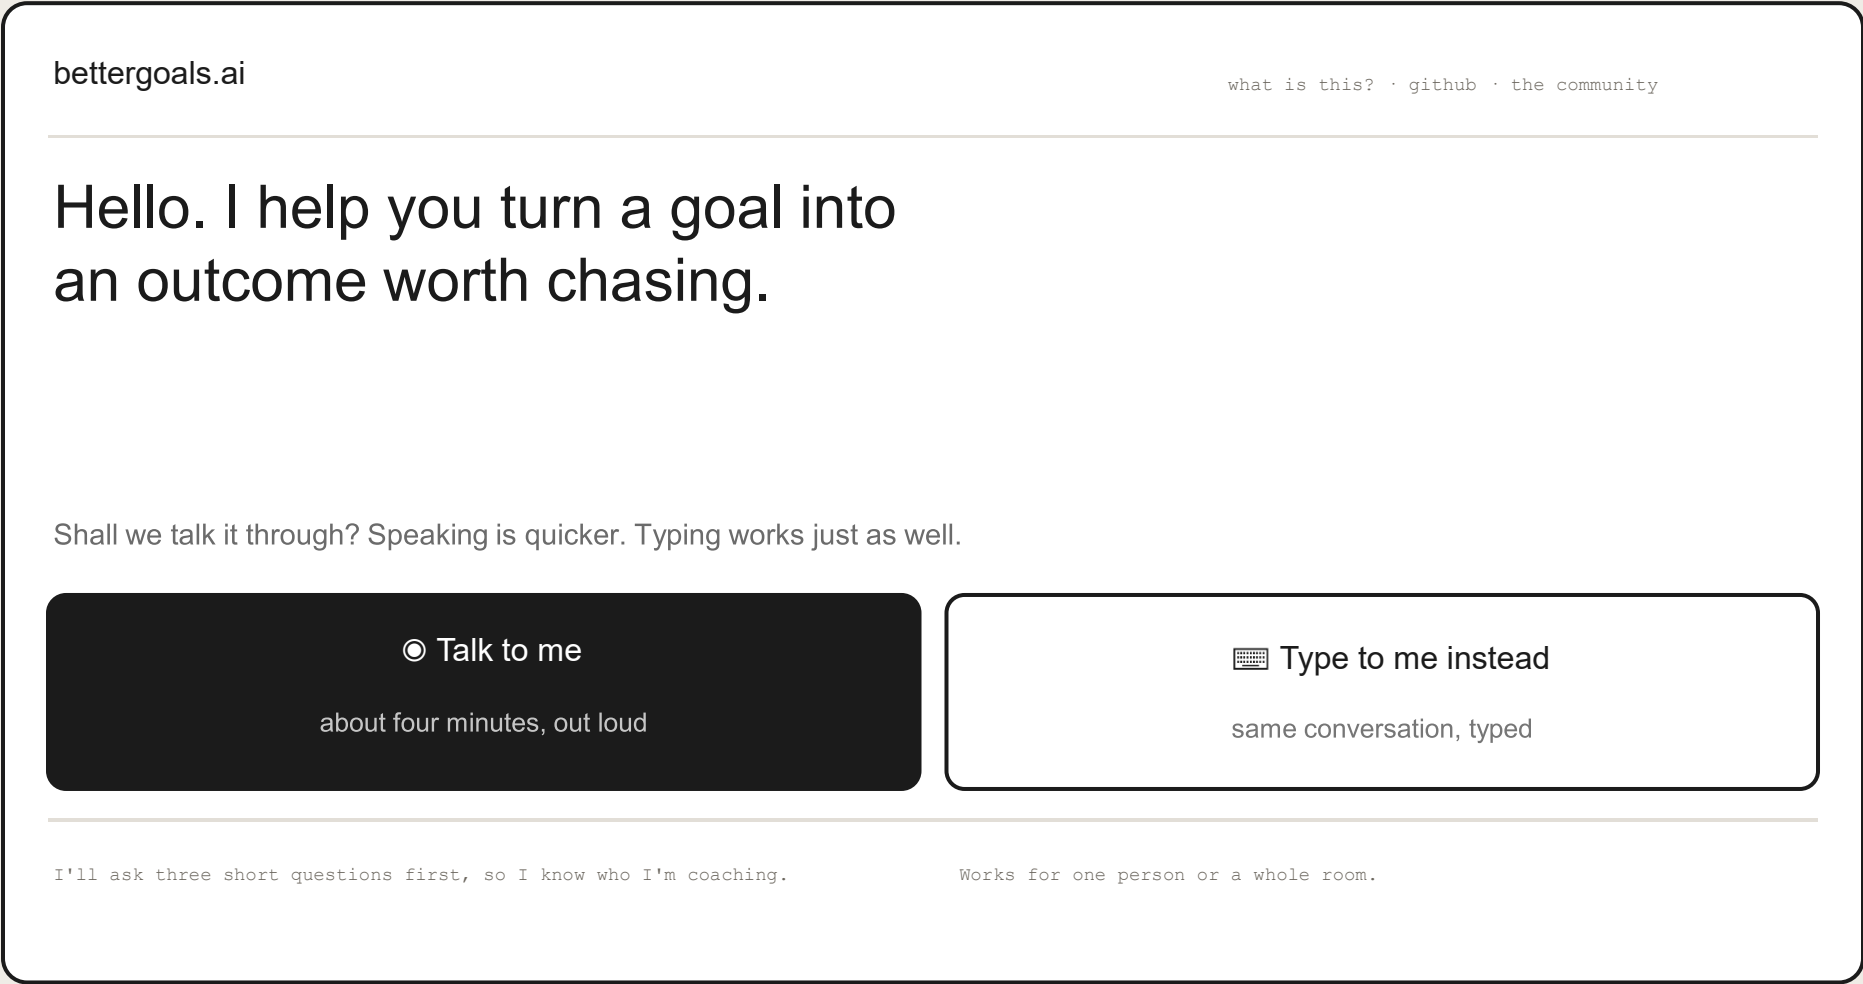

Nothing is ever replaced.

The triage chips stay above the canvas, greyed. The canvas reads as something the conversation produced — not a new tool you've been handed.

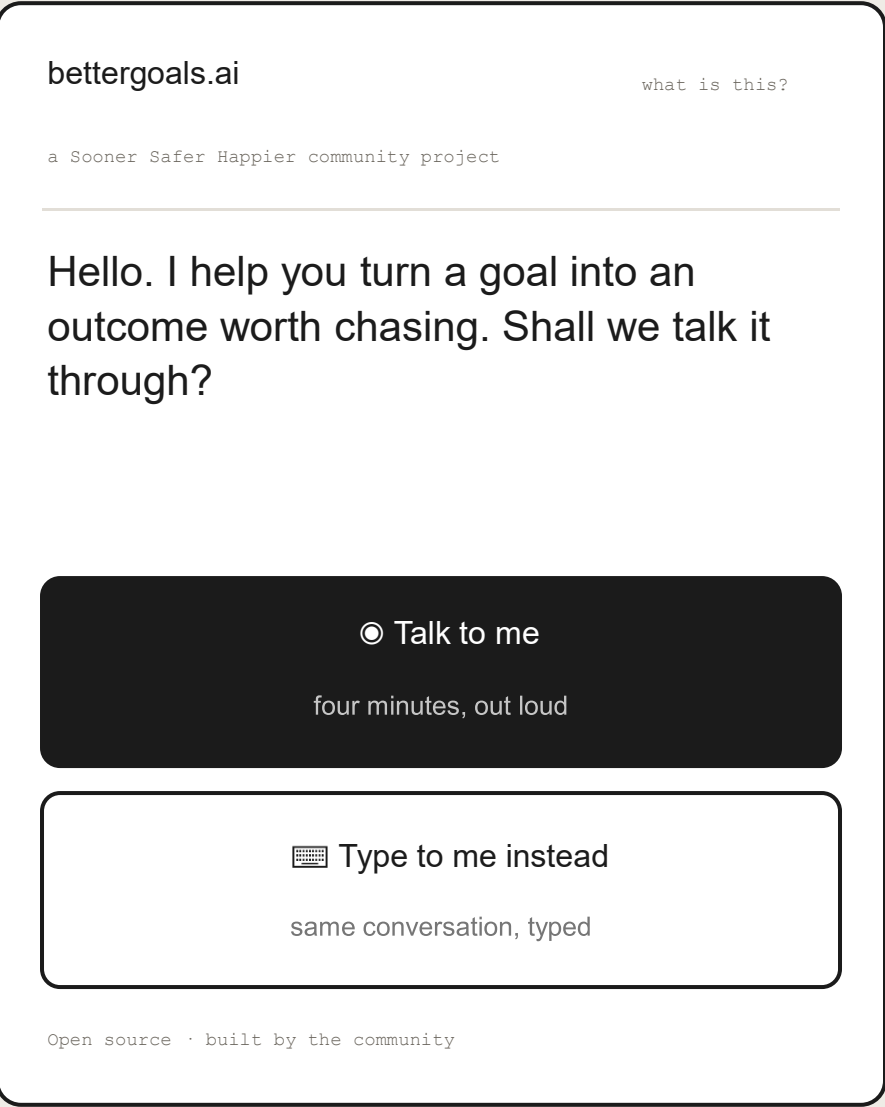

No progress bar, anywhere.

The only orientation is the canvas filling in. Step numbers here are my annotation of the coach's route, not UI.

DESKTOP

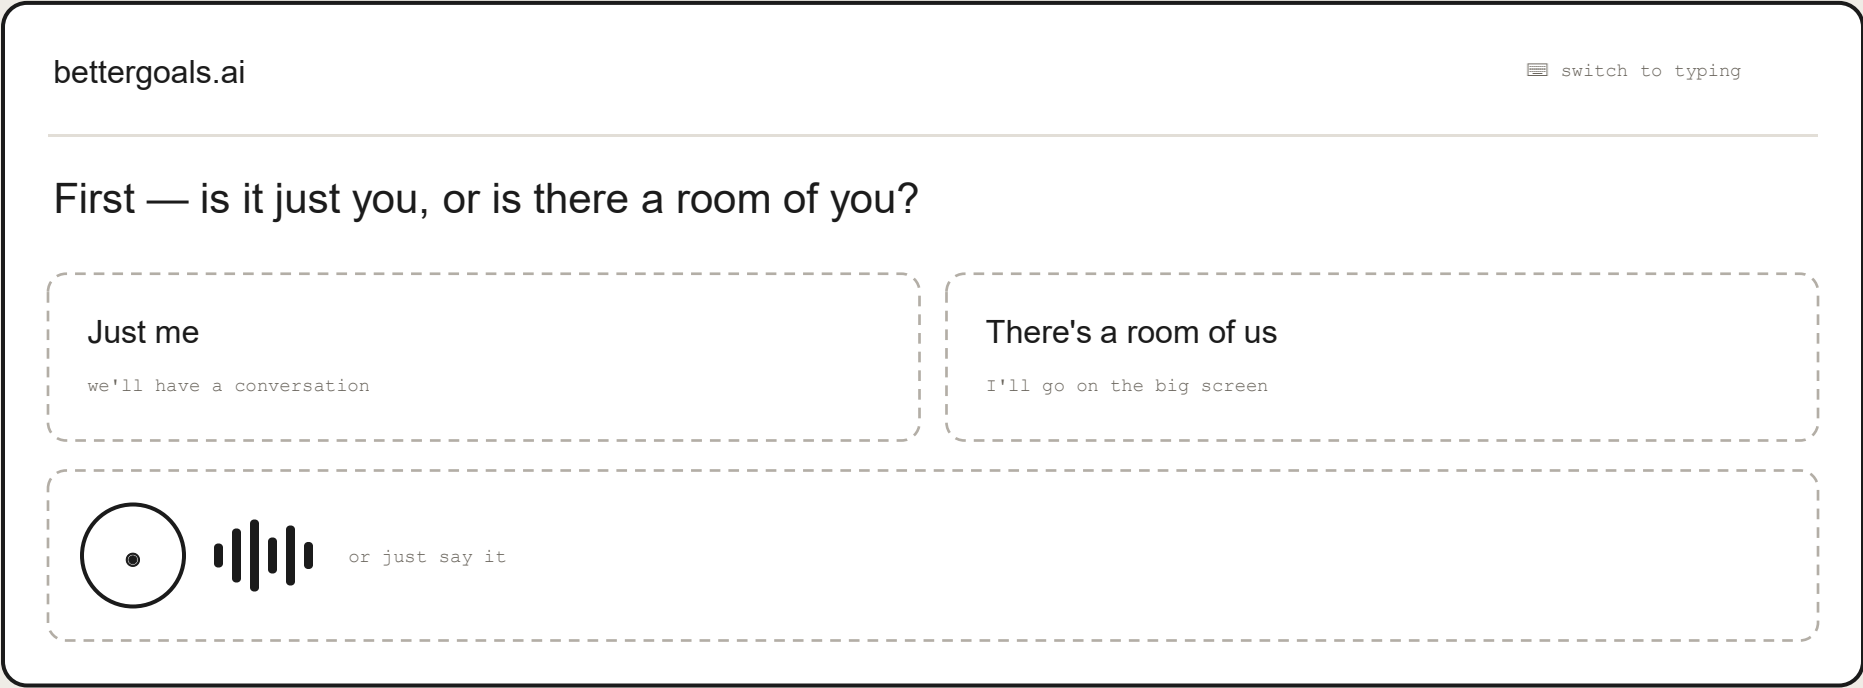

MOBILE

the moment before
anyone speaks

Unchanged from 1a. The
column that starts here is the
same column the canvas
eventually appears inside —
nothing in this screen gets
replaced later.

DESKTOP

MOBILE

answered → becomes
the first chip

Room answer forks the whole
run onto the big-screen spine
— same thirteen steps, score
suppressed.

03 What have you brought?

TRIAGE

a draft

Last one. Can you share it with me?

No account, no database, and I keep nothing when you close the tab. Even so — some wording isn't yours to paste. Your call, and either answer is a good one.

Yes — let's look together

coaching starts now

No — it stays with us

I'll set you up in there

the fork · the one place
the data line is said

Both answers leave this
screen forward. “Yes”
continues down the column
into step 05; “no” leaves the
spine for the handover you
already have.

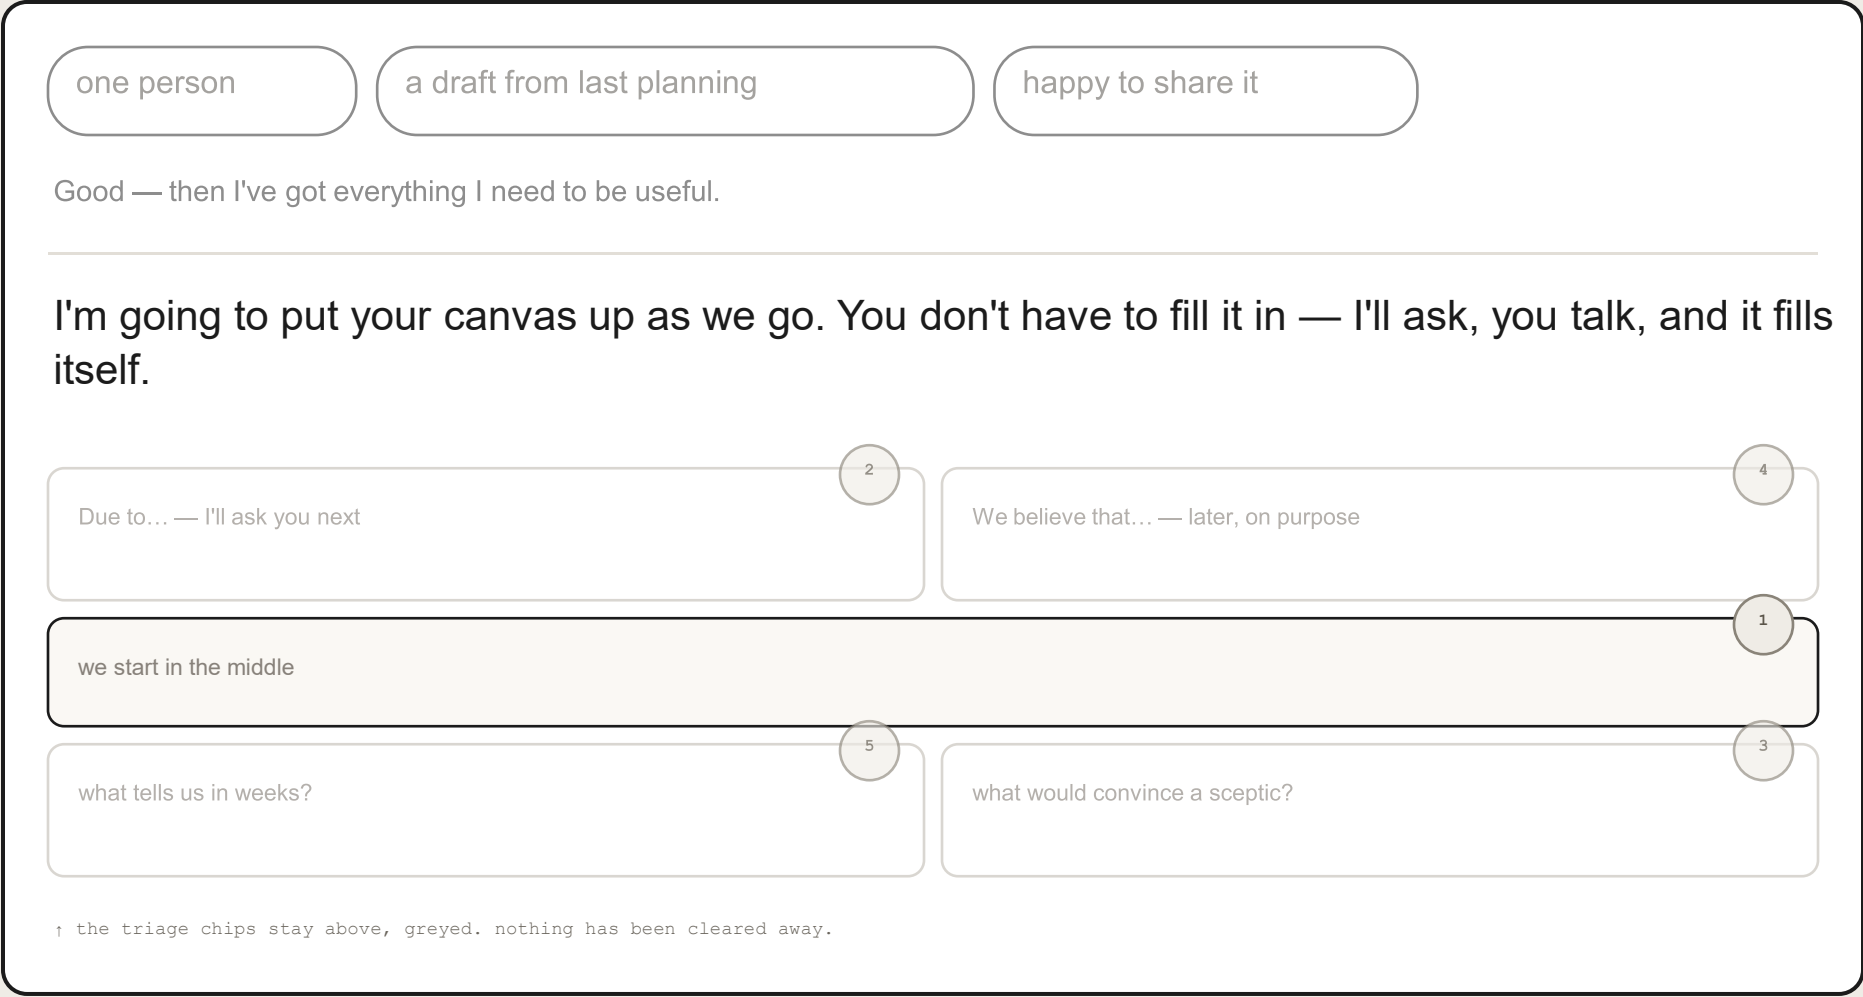

The column never closes.

The triage chips stay in place, greyed, above the canvas — so the canvas reads as something the conversation produced, not a new tool you've been handed. That's the whole trick, and it's why 1a and 2b stitch cleanly: both are one continuous downward column.

The cost: on desktop the canvas wants to be wide and the column wants to be narrow. I've let the canvas break out to the full column width and pushed the transcript above it — which means the coach's earlier turns scroll out of sight as the canvas grows.

This is the flow's biggest open question: a whole half of the product is gated behind one answer at step 04.

DESKTOP · MID-SCROLL, BOTH HALVES VISIBLE AT ONCE

the coach says why it's skipping the hypothesis

The jump is narrated in one sentence, in the flow of talk — no diagram, no “step 3 of 5”.

DESKTOP

MOBILE

the most interesting answer, not a blank to skip

Standing still has to *look* like progress: the box growing is the only visual cue that the conversation is going deeper rather than stalling.

DESKTOP

Can I take you back a step? I don't think the problem is here.

Your lagging measure is vague because “count faster” is vague. Let’s sharpen the behaviour and this box will write itself. Nothing you've said is wrong — we’re just fixing it upstream.

nothing is stored — if they don't take it here, it's gone

Download-first, and pushed again if they linger — this is the one place I'd allow a mild interruption, because there is no “come back later”.

1 · The seam works, the scroll doesn't

Keeping one column means the canvas inherits the column's width and the transcript scrolls away above it. Nothing breaks, but by step 10 the coach's earlier turns are a long way up — and on mobile the canvas is permanently collapsed to a thumbnail map.

2 · Everything good is behind step 04

Say “I can't share” and you never see the canvas, the nudge, or the takeaway. Pack one designed that handover as a win, but stitched end to end it's visibly the shorter road. Worth asking whether the canvas could run locally, unshared, for that path.

3 · Two chip systems now coexist

Triage answers are chips; coaching answers are sticky notes. That's a deliberate signal — chips are facts about you, stickies are your thinking — but it needs saying out loud or it reads as inconsistency.

4 · Thirteen steps, no progress bar

This is the longest thing here and it deliberately never tells you how far through you are. The only orientation is the canvas filling. If testing says people feel lost, the fix is more narration from the coach, not a bar.

1 Does the canvas pin, or scroll?

Pinning keeps the coach's turns in view but turns the canvas into a panel — and 2b's inflating box stops being possible.

2 Does the can't-share path get a canvas?

Right now everything good sits behind step 04. A local, unshared canvas would put both roads on equal footing.

3 Does room mode run this same spine?

Same thirteen steps on a big screen with the nudge suppressed — or a shorter facilitator-led variant.

The seam itself is the part I'd protect.
Everything else here can move without
breaking the feeling that one conversation is
still running.
